## FMTVDM WILL BE REQUIRED TO PROVE TREATMENTS.

and by the way, it's not racist or xenophobic to call CoVid-19 the Wuhan Virus - because like so many other diseases we have named, that's where it started.

It's time to put pressure on China to practice social distancing and by social distancing I mean the distance between species.

The process of having people and animals of various species in such close proximity as these "wet markets" do produces the ideal environment for the generation of these previously unseen by human viruses. Viruses to which we have no immunity and as we have seen are so deadly.

These dangerous viruses always require multiple species passing the virus back and forth until adequate mutational changes occur to allow the viruses to infect, harm and kill people.

This has nothing to do with Asian Americans, or Spanish Americans (Spanish Flu), or people from Connecticut (Lyme Disease), or Middle Eastern People (MERS: Middle Eastern Respiratory Syndrome Coronavirus), or West Nile virus, Zika, Ebola, Hantavirus, or people from the Rocky Mountains (Rocky Mountain Spotted Fever), ... well hopefully you get the picture.

When this CoVid-19 Wuhan Virus has been successfully addressed - which we can do with FMTVDM - there will be another, and another, and another, until we learn to change what people are doing, and without FMTVDM you won't be ready to deal with the next one.

One more thing --- back in 1995, when I introduced "The Pathogenesis of Vascular Disease" [1], which I called the "Inflammation and Heart Disease" Theory [2], I specifically included in that theory the impact of infectious diseases - including viruses - and their role in worsening chronic inflammatory disease, like Coronary Artery Disease. In fact, I have specifically published research showing the effect of treating these diseases & reducing the inflammation - specifically interleukin-6 [3].

Had you read this material and learned from what has already been published - including how to treat patients with Adult Respiratory Distress Syndrome while on a ventilator - there would have been fewer deaths.
